QoS (Download) -- Classification Rules

☒ Enable Quality of Service (Download Direction)

Quality of Service (QoS) provides a way to control how available bandwidth is allocated.

Connections are classified into different "service classes," each of which is allocated a share of the available bandwidth. QoS should be applied in cases where you want to divide available bandwidth between competing requirements. For example if you want your VoIP phone to work correctly while downloading videos. Another case would be if you want your bit torrents throttled back when you are web surfing.
